

For Information Displays

Anthony Starks  
@ajstarks

Go is great in the back end

A wide-angle photograph of a dramatic sky. The upper portion of the image is dominated by a large, bright white cumulus cloud formation. This main cloud is textured and layered, with some darker, more solid areas on its right side. Below this, the sky transitions into a darker shade of blue, with scattered smaller, puffy white clouds. The overall lighting suggests a bright day with strong sunlight filtering through the clouds.

But sometimes it's about the picture

# Information Displays

## Packages and Tools

## Lots of pictures

## Why Go?

Edward Tufte

Display data for precise, effective, quick analysis,  
Small multiples, optimizing the data-ink ratio,  
Visual and beautiful evidence.

Nigel Holmes

Designing for the context: The data visualizer  
asks: “What’s the data?”, the infographics designer:  
“What’s the Story?”

An interesting arrangement  
of text and graphics designed  
to convey a message

# I hate pushing pixels

programs are so much  
better at it

    "github.com/ajstarks/svg"
    "os"
)

func main() {
    canvas := svg.New(os.Stdout)
    width := 700
    height := 500
    style := "font-size:72pt;fill:white;text-anchor:middle"

    canvas.Start(width, height)
    canvas.Rect(0, 0, width, height)
    canvas.Circle(width/2, height, width/2, "fill:rgb(77, 117, 232)")
    canvas.Text(width/2, height*3/4, "hello, world", style)
    canvas.End()
}
```

localhost:1999/hwsvg.go

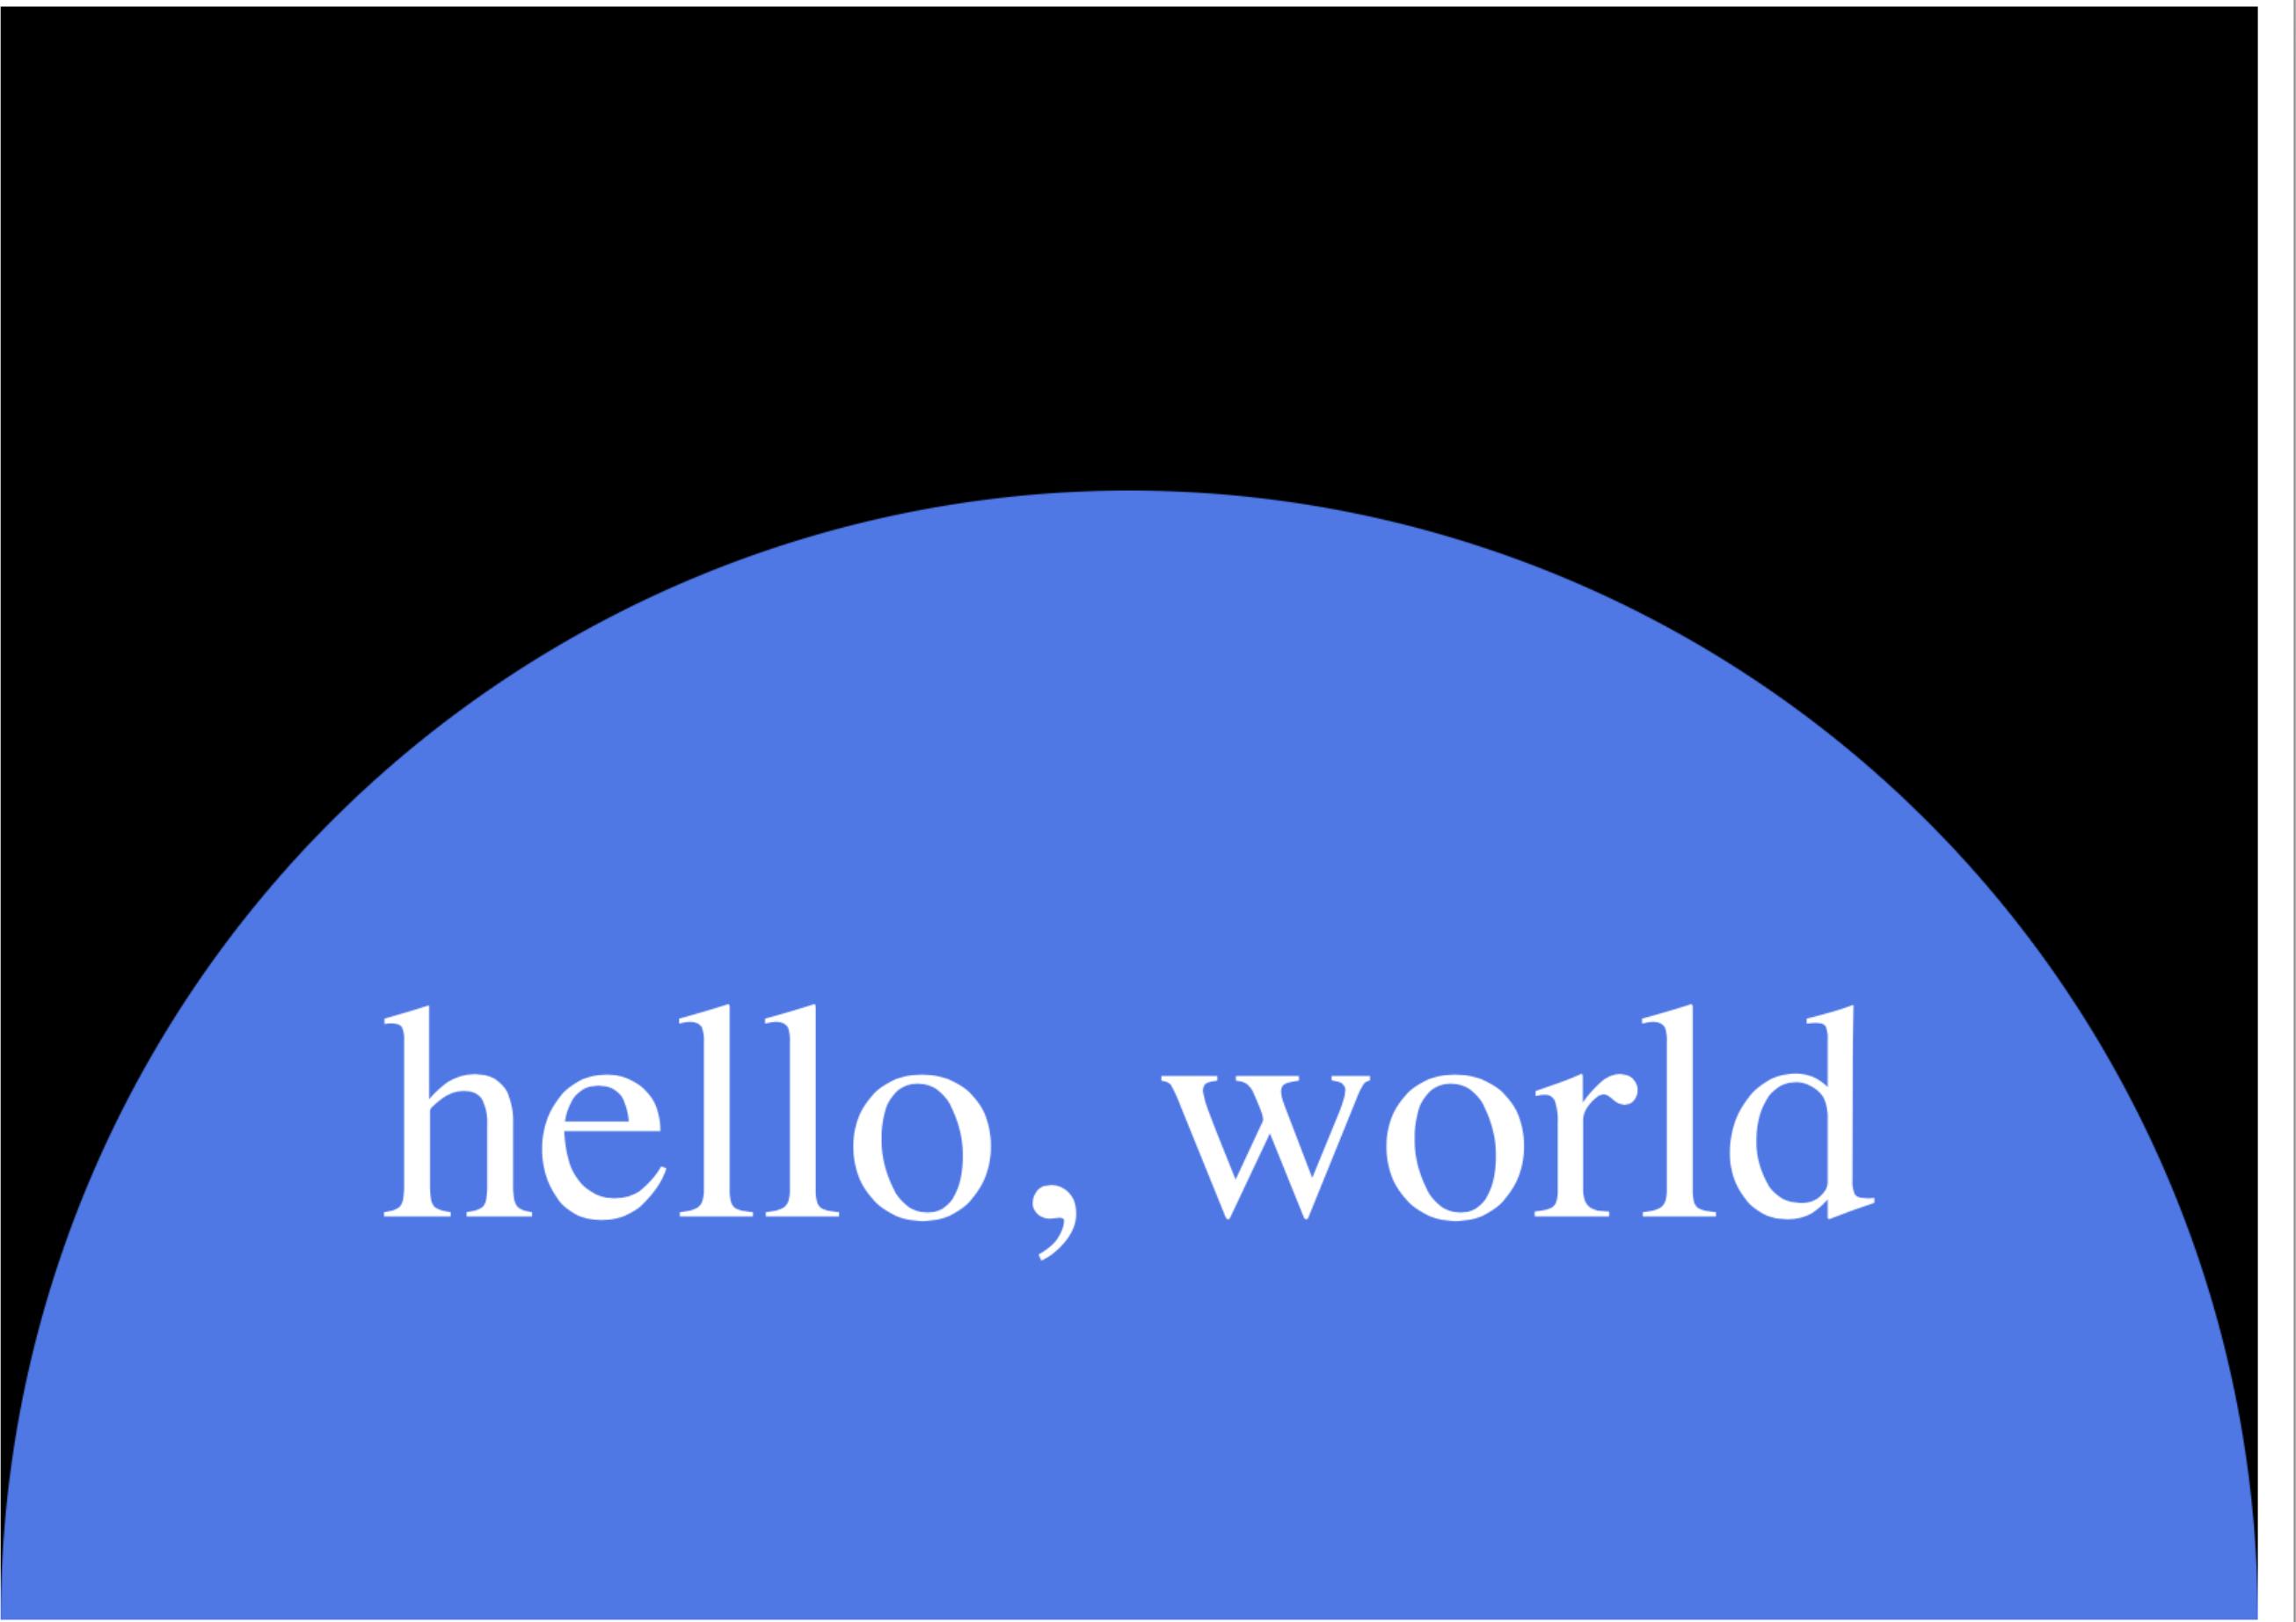

```
package main

import (
    "github.com/ajstarks/svg"
    "os"
)

func main() {
    canvas := svg.New(os.Stdout)
    width := 700
    height := 500
    style := "font-size:72pt;fill:white;text-anchor:middle"

    canvas.Start(width, height)
    canvas.Rect(0, 0, width, height)
    canvas.Circle(width/2, height, width/2, "fill:rgb(77, 117, 232)")
    canvas.Text(width/2, height*3/4, "hello, world", style)
    canvas.End()
}
```

(Shift-Enter to compile and run.)  Compile and run after each keystroke

The image shows a web-based development environment for Go. On the left, a code editor displays a simple Go program that generates an SVG output. The program imports the `svgo` library and `os` package. It defines a `main` function that creates a new SVG canvas from `os.Stdout`, sets the width to 700 and height to 500 pixels, and defines a font style with a size of 72pt, white fill, and center text alignment. The canvas starts at the specified dimensions, draws a black rectangle, a blue circle centered at (width/2, height) with a radius of width/2, and the text "hello, world" in white at the position (width/2, height\*3/4). The text is styled with the previously defined font. The output on the right is a large blue circle on a black background containing the white text "hello, world". At the bottom of the code editor, there is a note about using Shift-Enter to compile and run, and a checkbox for "Compile and run after each keystroke".

svgplay

```
localhost:1999/hwsvg.go
```

```
package main

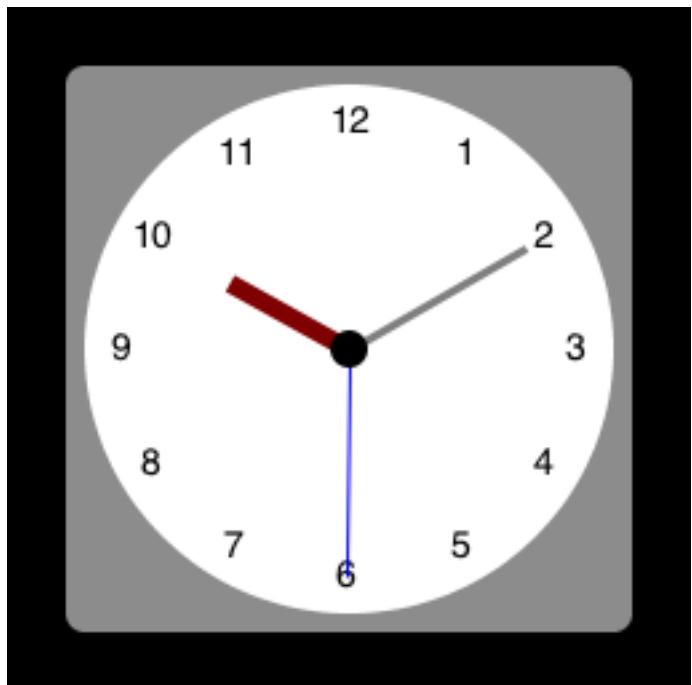

import (
    "github.com/ajstarks/svggo"
    "os"
)

func main() {
    canvas := svg.New(os.Stdout)
    width := 700
    height := 500
    style := "font-size:72pt;fill:white;text-anchor:middle"

    canvas.Start(width, height)
    canvas.Rect(0, 0, width, height)
    canvas.Circle(width/2, height, width/2, "fill:rgb(255,0,0)")
    canvas.Text(width/2, height*3/4, "hello, Mars", style)
    canvas.End()
}
```

(Shift-Enter to compile and run.)  Compile and run after each keystroke

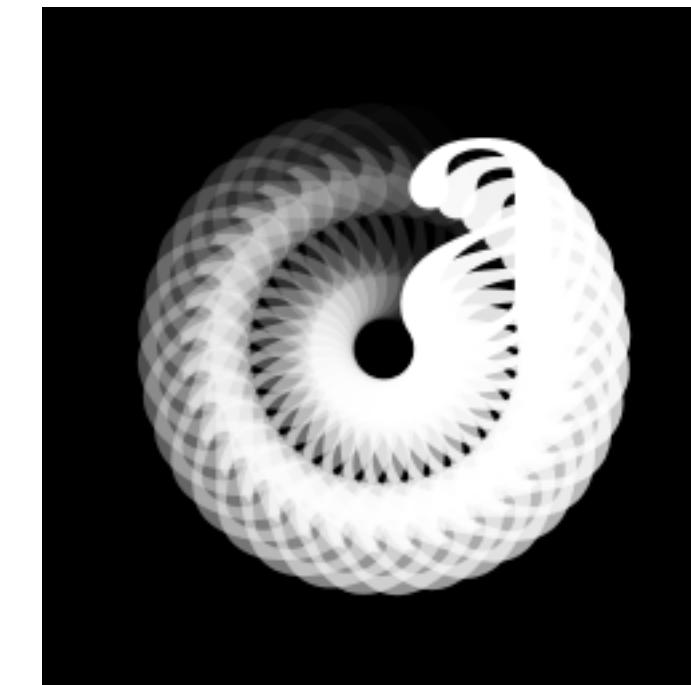

The screenshot shows a web-based development environment. On the left, a code editor displays a Go program named 'hwsvg.go'. The code creates a new SVG canvas from standard output, sets dimensions of 700x500 pixels, and draws a red circle at the center. It then prints the text 'hello, Mars' in large white font at the top of the circle. On the right, the browser's main area displays the resulting SVG output: a solid black rectangle containing a large red circle with the white text 'hello, Mars' centered within it.

## Sample Bullet Graph

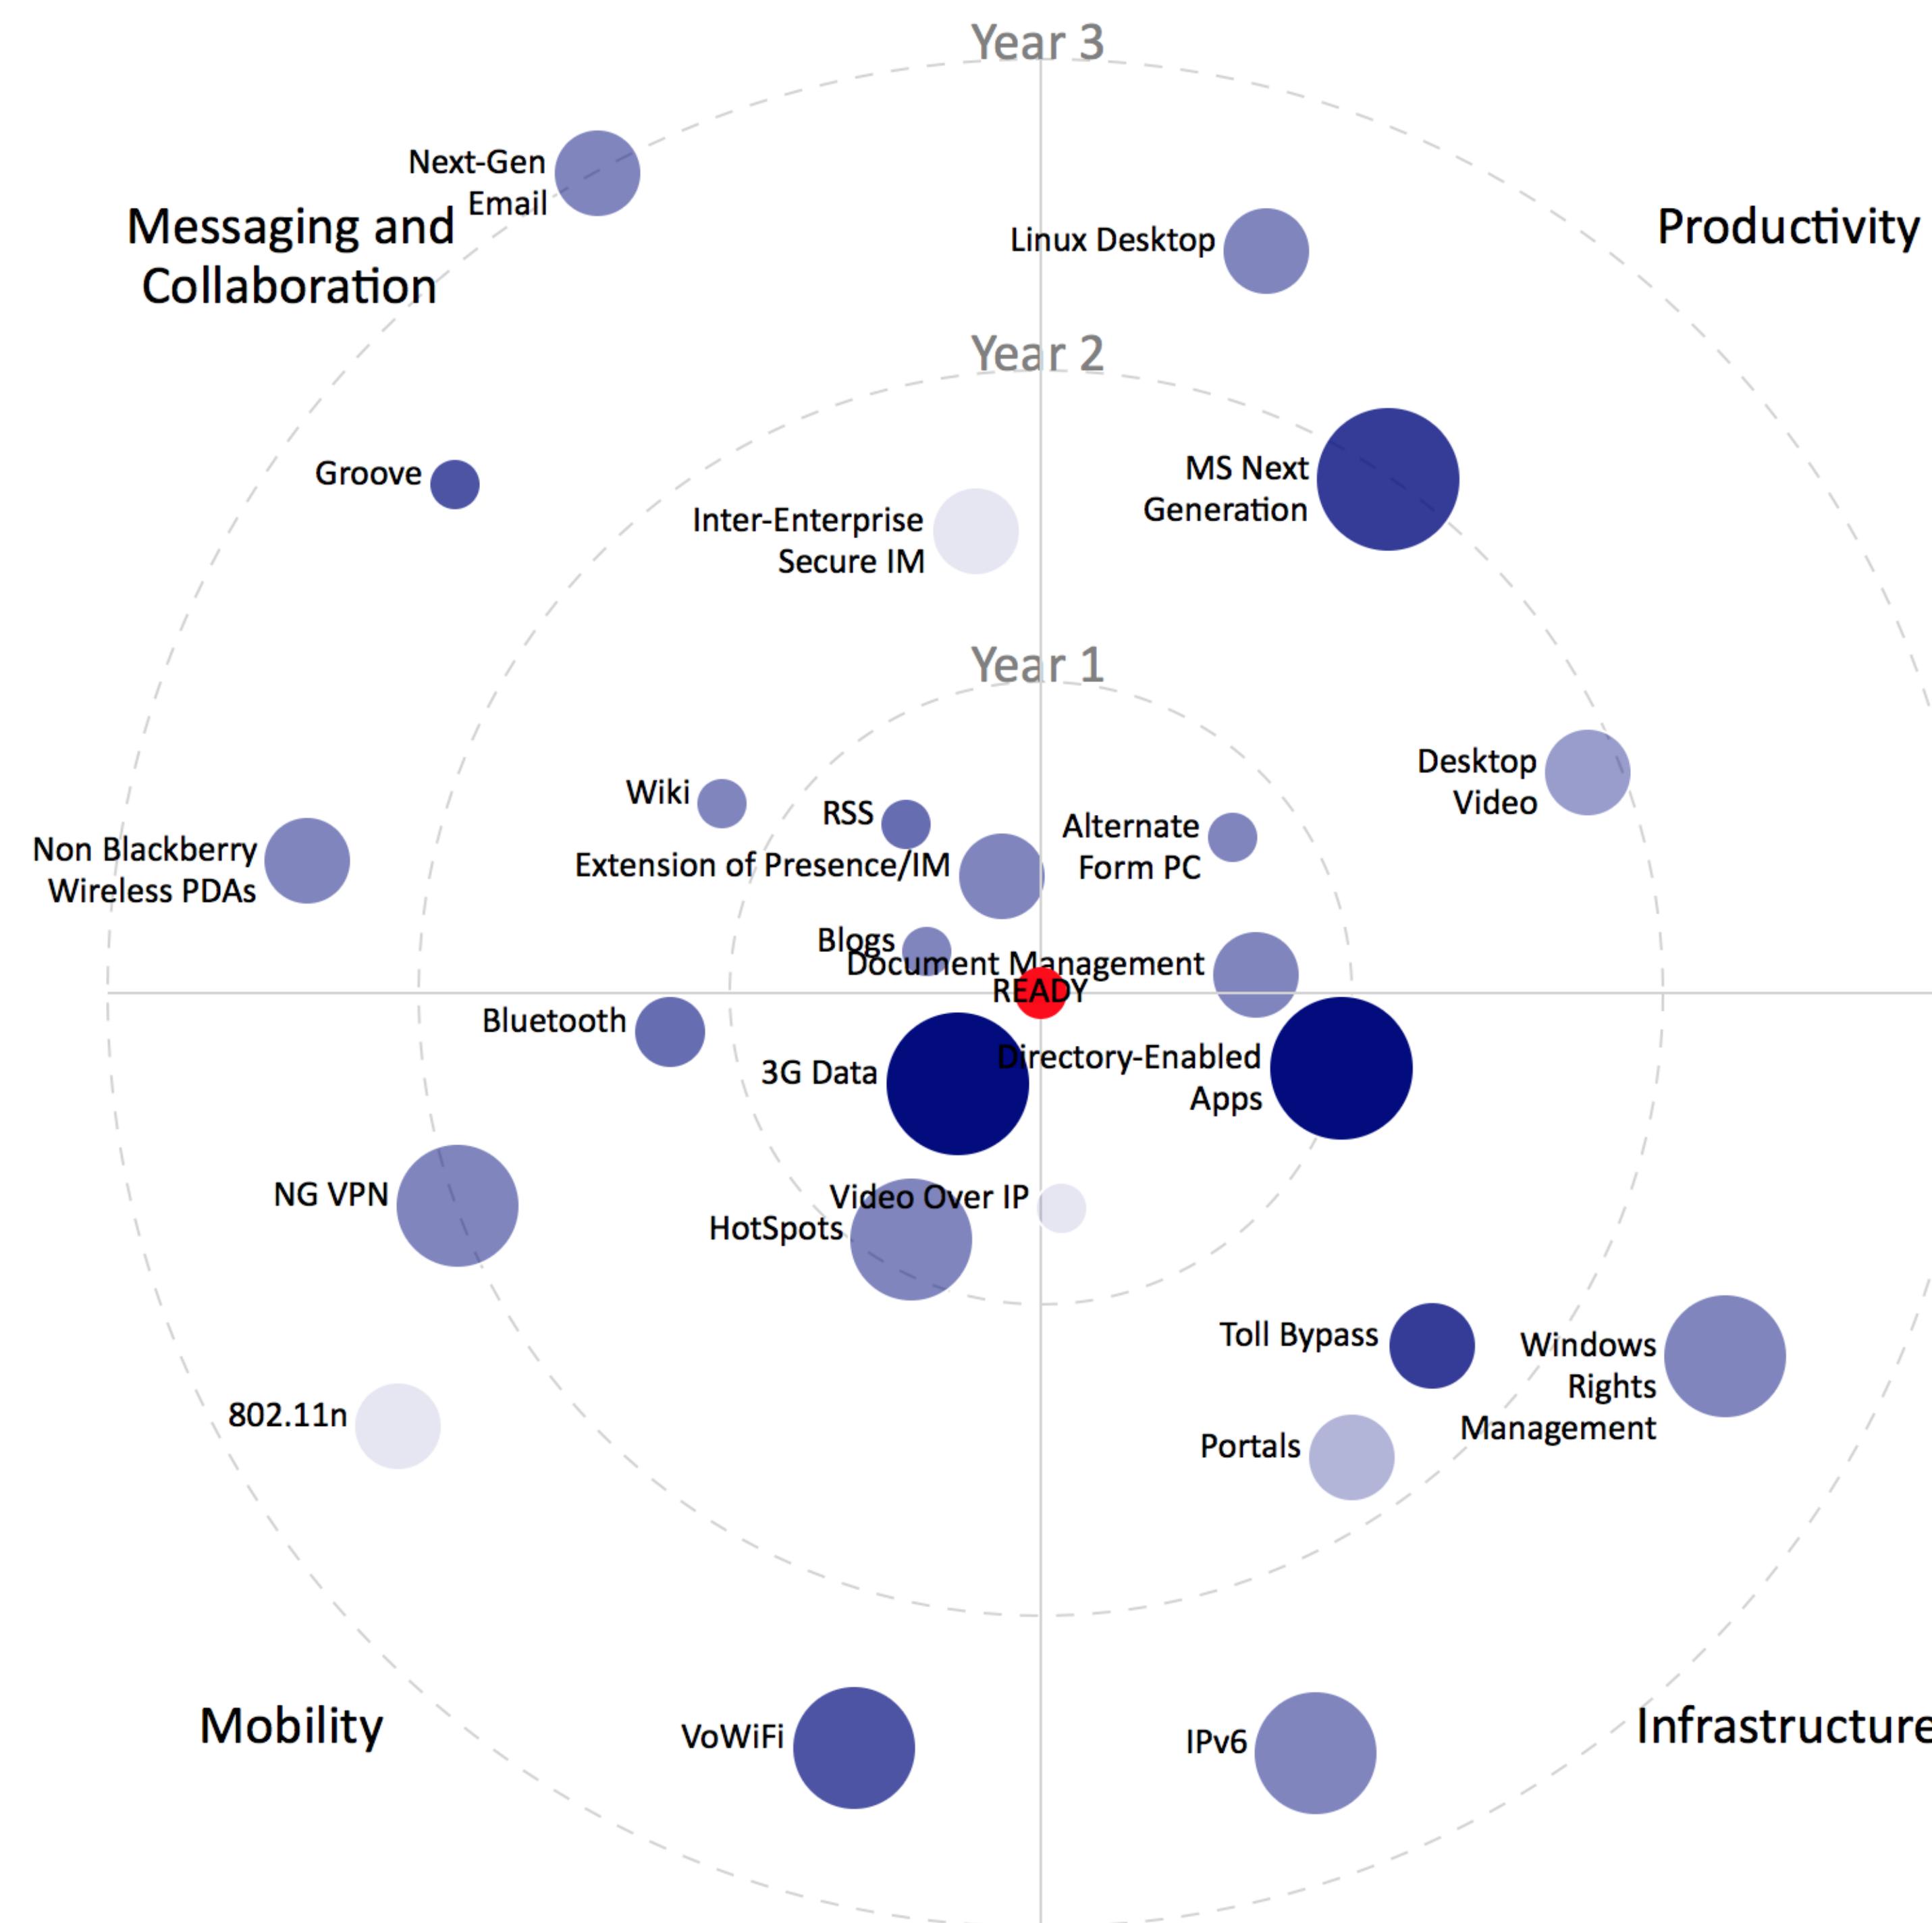

The bullet graph features a single, primary measure (for example, current year-to-date revenue) compares that measure to one or more other measures to enrich its meaning, for example, compared to a target), and displays it in the context of qualitative ranges of performance, such as poor, satisfactory, and good.

## OpenVG on the Raspberry Pi

## Why I use Go

Anthony Starks  
@ejstars  
ajstars@gmail.com

```
package main
import "fmt"

func main() {
    fmt.Println("hello, world")
}
```

This is the traditional hello, world program.  
It's six lines long, and imports the fmt package,  
leading some to be surprised at the size of the resulting binary.

```
package main

import (
    "bufio"
    "github.com/ajstarks/openvg"
    "os"
)

func main() {
    width, height := openvg.Init()

    w2 := openvg.VGfloat(width / 2)
    h2 := openvg.VGfloat(height / 2)
    w := openvg.VGfloat(width)

    openvg.Start(width, height)                      // Start the picture
    openvg.BackgroundColor("black")                  // Black background
    openvg.FillRGB(44, 100, 232, 1)                // Big blue marble
    openvg.Circle(w2, 0, w)                         // The "world"
    openvg.FillColor("white")                       // White text
    openvg.TextMid(w2, h2, "hello, world", "serif", width/10) // Greetings
    openvg.End()                                    // End the picture
    bufio.NewReader(os.Stdin).ReadBytes('\n') // Pause until [RETURN]
    openvg.Finish()                                // Graphics cleanup
}
```

# Document Links

Add web and mailto links with the link attribute of the text element.

Once rendered as a PDF, clicking on the link opens the default browser or email client.

The image contains two screenshots. The top screenshot shows a PDF viewer window titled "deck-fira-4x3.pdf (page 53 of 57)". It displays a quote in white text on a dark blue background: "Python and Ruby programmers come to Go because they don't have to surrender much expressiveness, but gain performance and get to play with concurrency." Below the quote, it says "Less is exponentially more" and "Rob Pike". The bottom screenshot shows a web browser window titled "command center: Less is e...". The URL in the address bar is "commandcenter.blogspot.com/2012/06/less-is-exp...". The page content is identical to the quote in the PDF, along with some additional text: "What you're given is a set of powerful but easy to understand, easy to use building blocks from which you can assemble—compose—a solution to your problem. It might not end up quite as fast or as sophisticated or as ideologically motivated as the solution you'd write in some of those other languages, but it'll almost certainly be easier to write, easier to read, easier to understand, easier to maintain, and maybe safer." Below this, there is another quote: "To put it another way, oversimplifying of course: Python and Ruby programmers come to Go because they don't have to surrender much expressiveness, but gain performance and get to play with concurrency." At the bottom, there is a final note: "C++ programmers *don't* come to Go because they have fought hard to gain exquisite control of their programming domain, and don't want to surrender any of it. To them, software isn't just about getting the job done, it's about doing it a certain way." The issue is then summarized as "The issue, then, is that Go's success would contradict their world view."

Python and Ruby programmers come to Go because they don't have to surrender much expressiveness, but gain performance and get to play with concurrency.

Less is exponentially more

Rob Pike

What you're given is a set of powerful but easy to understand, easy to use building blocks from which you can assemble—compose—a solution to your problem. It might not end up quite as fast or as sophisticated or as ideologically motivated as the solution you'd write in some of those other languages, but it'll almost certainly be easier to write, easier to read, easier to understand, easier to maintain, and maybe safer.

To put it another way, oversimplifying of course:

Python and Ruby programmers come to Go because they don't have to surrender much expressiveness, but gain performance and get to play with concurrency.

C++ programmers *don't* come to Go because they have fought hard to gain exquisite control of their programming domain, and don't want to surrender any of it. To them, software isn't just about getting the job done, it's about doing it a certain way.

The issue, then, is that Go's success would contradict their world view.

<b>vet</b>	run go tool vet on packages

# Go Proverbs

-  Don't communicate by sharing memory, share memory by communicating.
-  Concurrency is not parallelism.
-  Channels orchestrate; mutexes serialize.
-  The bigger the interface, the weaker the abstraction.
-  Make the zero value useful.
-  interface{} says nothing.
-  Gofmt's style is no one's favorite, yet gofmt is everyone's favorite.
-  A little copying is better than a little dependency.
-  Syscall must always be guarded with build tags.
-  Cgo must always be guarded with build tags.
-  Cgo is not Go.
-  With the unsafe package there are no guarantees.
-  Clear is better than clever.
-  Reflection is never clear.
-  Errors are values.
-  Don't just check errors, handle them gracefully.
-  Design the architecture, name the components, document the details.
-  Documentation is for users.
-  Don't panic.

Don't communicate  
by sharing memory,  
share memory by  
communicating.

The bigger the interface,  
the weaker the abstraction.

Make the zero  
value useful.

## Chapter V

## Advice from a Caterpillar

THE Caterpillar and Alice looked at each other for some time in silence: at last the Caterpillar took the hookah out of its mouth, and addressed her in a languid, sleepy voice. “Who are you?” said the Caterpillar. This was not an encouraging opening for a conversation. Alice replied, rather shyly, “I—I hardly know, sir, just at present—at least I know who I was when I got up this morning, but I think I must have been changed several times times since then.”

"You promised to tell me your history, you know," said Alice, "and why it is you hate—C and D," she added in a whisper, half afraid that it would be offended again. "Mine is a long and a sad tale!" said the Mouse, turning to Alice, and sighing. "It is a long tail, certainly," said Alice, looking down with wonder at the Mouse's tail; "but why do you call it sad?" And she kept on puzzling about it while the Mouse was speaking, so that her idea of the tale was something like this:—

Fury said to a mouse, That he met in the house,  
"Let us both go to law:I will prosecute  
YOU—Come, I'll take no denial; We must have a trial:For really this morning I've nothing to do."  
Said the mouse to the cur, "Such a trial, dear Sir, With no jury or judge, would be wasting our breath."  
"I'll be judge, I'll be jury," Said cunning old Fury:  
"I'll try the whole cause, and condemn you to death."

rottext.go [37]

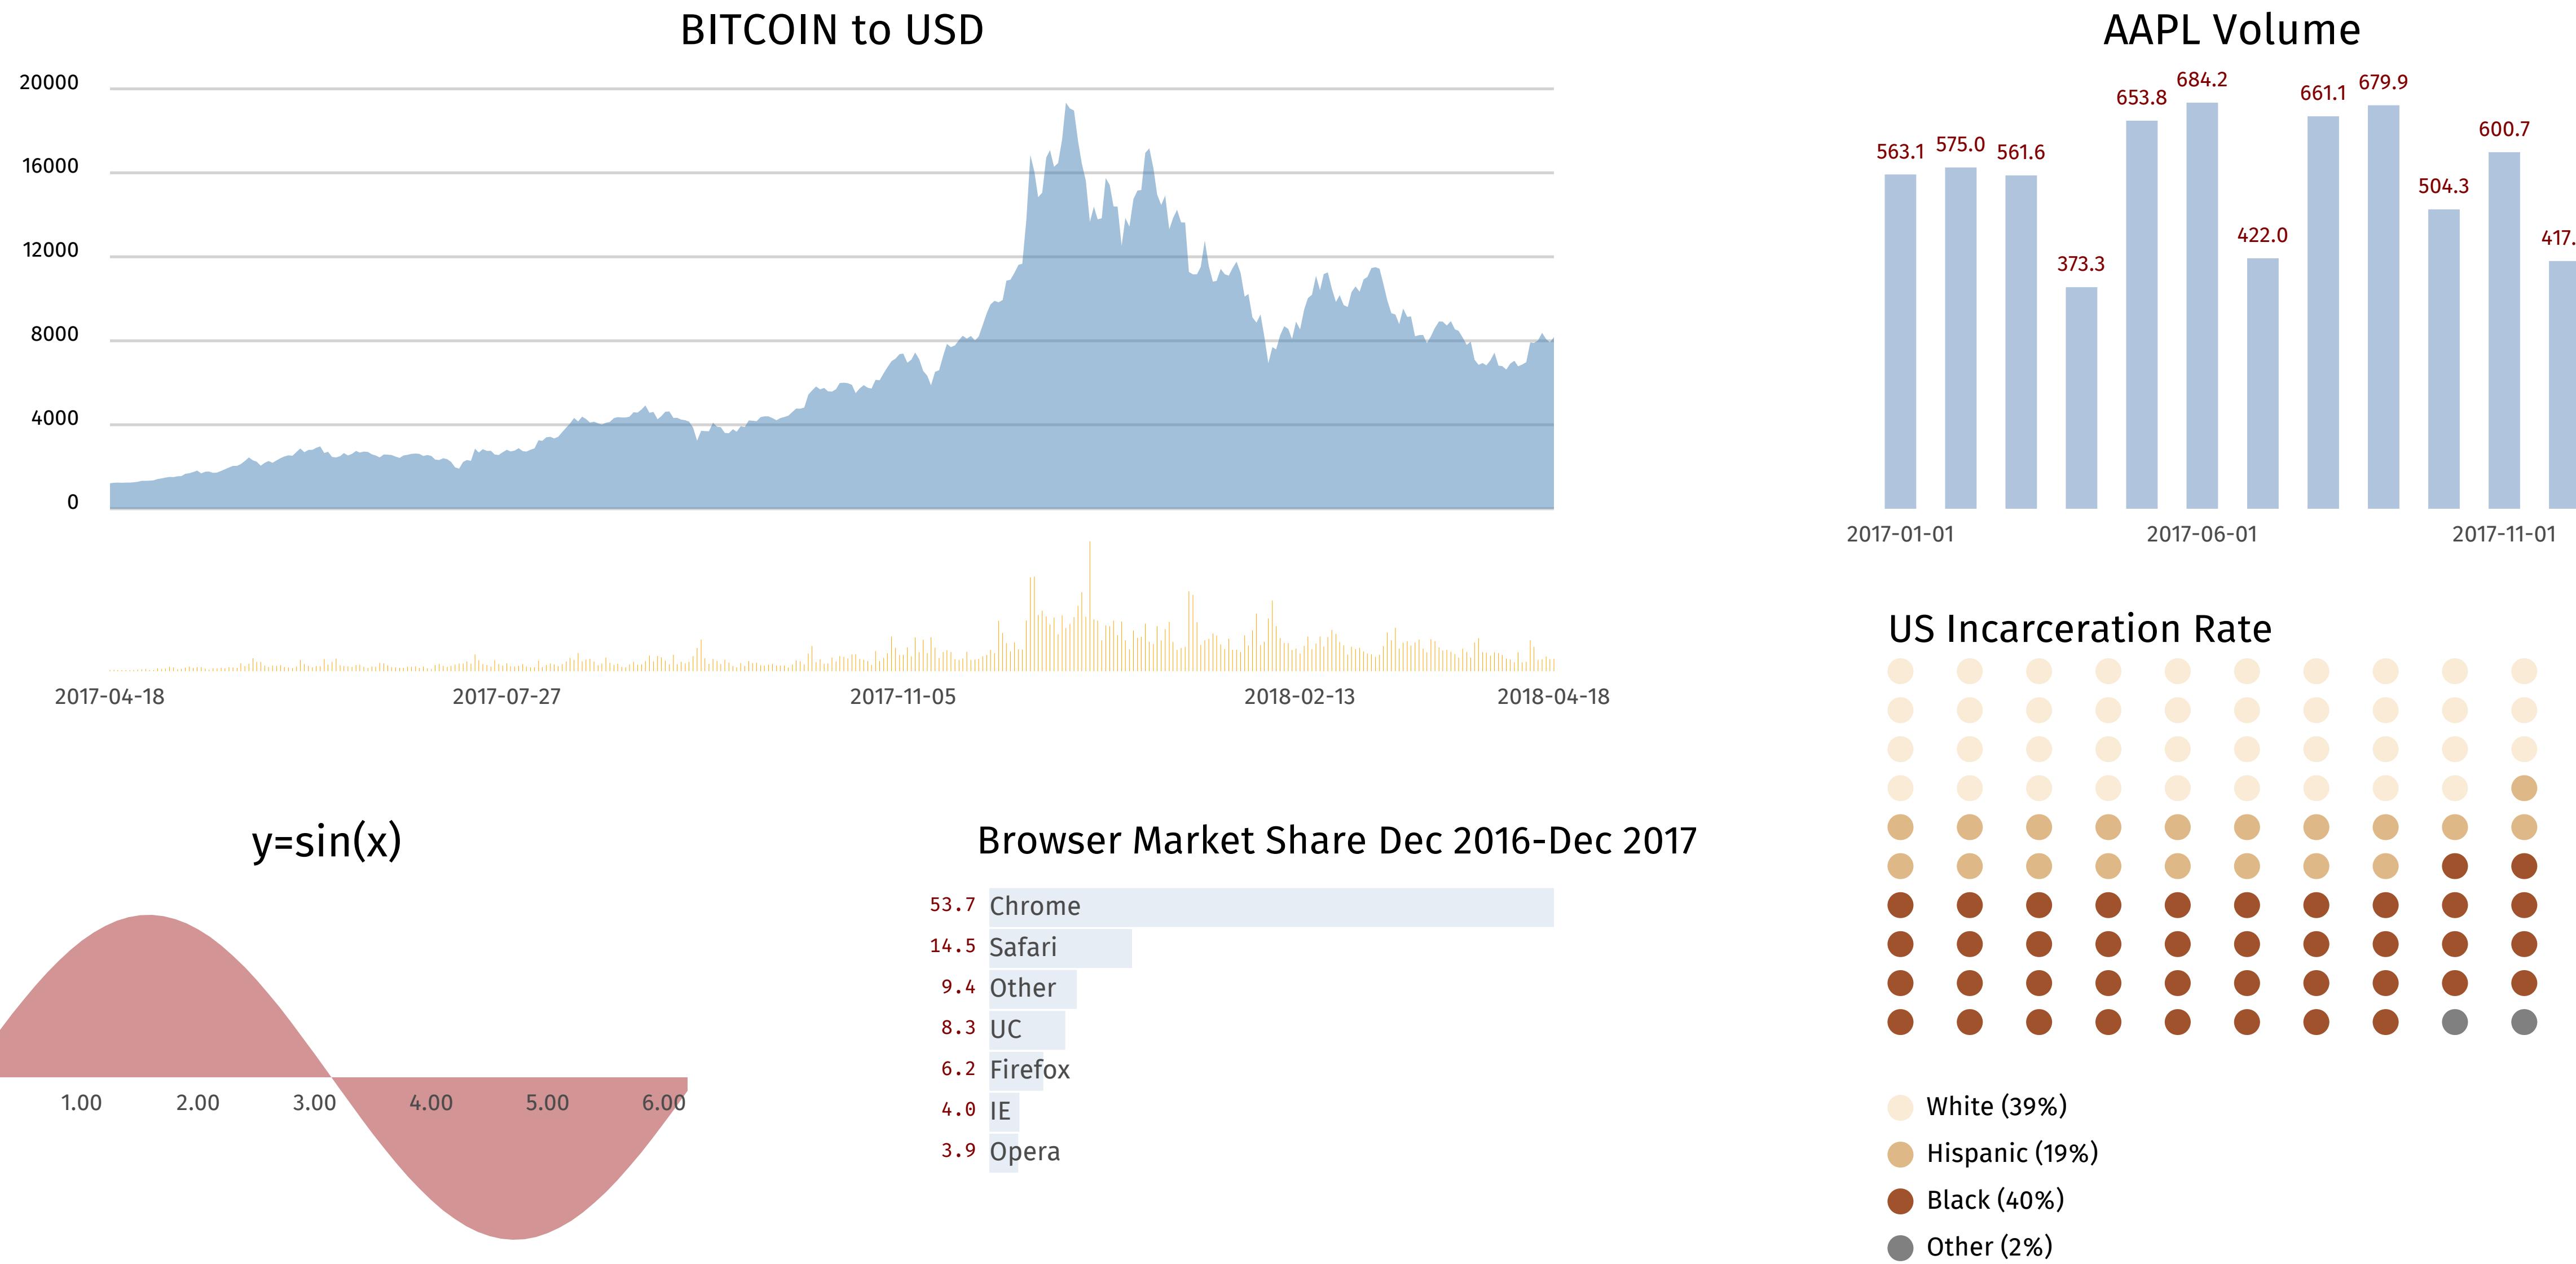

The new masters of our universe  
are people who are essentially  
only half-educated.

They have had no exposure to the humanities or the social sciences, the academic disciplines that aim to provide some understanding of how society works, of history and of the roles that beliefs, philosophies, laws, norms, religion and customs play in the evolution of human culture

# A record 64 million Americans live in multigenerational households

The number and share of Americans living in multi-generational family households have continued to rise, despite improvements in the U.S. economy since the Great Recession. In 2016, a record 64 million people, or 20% of the U.S. population, lived with multiple generations under one roof, according to a new Pew Research Center analysis of census data.
